AUTHOR: Gikis, A. F., Candidate of Technical Sciences, Docent
TITLE: Inter-University Scientific Conference on Electric Measuring Instruments and Technical Means of Automation (Mezhvuzovskaya nauchnaya konferentsiya po elektromeritel'nyy priboram i tekhnicheskim sredstvam avtomatiki)

PERIODICAL: Izvestiya Vysshikh Uchebnykh Zavedeniy, Elektromekhanika, 1958, Nr 9, pp 132-135 (USSR)

ABSTRACT: The conference was held at the Leningradskiy elektrotekhnicheskiy institut imeni V. I. Ul'yanova (Lenin) (Leningrad Electro-technical Institute imeni V. I. Ul'yanov (Lenin)) on November 11-15, 1958. The representatives of eleven higher teaching establishments and three research institutes participated and a large number of specialists of various industrial undertakings were present.

Corresponding Member of the Ac.Sc. USSR Professor E. B. Karandeyev presented the paper "Application of semi-conductors for metering purposes". Assistant G. M. Novopashenny presented the paper "Metering amplifiers with semi-conductor triodes". Docent Ye. Y. Kozlovskiy, Assistants N. A. Smirnov, Ye. Ye. Afanas'yev and Ye. P. Ryamov (Leningrad Elektrotekhnicheskii Institut) presented the paper "Semi-conductor precision instrument for measuring the frequency by the method of counting impulses". The described instrument enables measuring the frequency of harmonic oscillations which occur once only; the frequency of the input oscillations is amplified 24 times and the error in measurement does not exceed 2×10^{-5} . A number of papers were presented on measuring and producing instruments based on recently discovered physical phenomena.

3740. The splitting of pentose by the blood serum of cancer patients
(Russian text) ZBARSKY I. B., UGOLEVA N. A. and ARTEMIEVA L. P. Oncol. Inst.,
Moscow *Vopr. Onkol.* 1958, 4/5 (561-562)

The blood serum from 9 healthy persons and 12 cancer patients was tested. Pentolytic properties were not present. Apparent splitting can be explained by the inaccuracy of the furfural method of pentose determination, especially when arabinose and ribose are used. The pentolytic properties of the serum cannot be used as a cancer test.

TITLE: Silicon Single Crystals for Power Rectifiers²⁵

PERIODICAL: Elektrotechnický obzor, 1960. Vol.49, No.11, pp.575-578

TEXT: After a discussion of the parameters of silicon single crystals for the manufacture of power rectifiers, the authors describe equipment for the preparation of single crystals by the suspended zone method. Heywang (Ref.3) established by calculation that for suspended zone melting of silicon, the maximum possible ingot diameter is 12 mm. In view of these results, Mataré solved the problem of manufacture of wider crystals by compressing narrow crystals in a specially shaped inductor of a high frequency generator. Practical experience has shown that the calculations of Heywang were based on incorrect assumptions and yielded erroneous results. Mička and Reichl (Ref.4) established in laboratory tests at TESLA, Rožnov the possibility of zoning ingots which are wider than 20 mm. This result was confirmed by results obtained in the ČKD Laboratories

Card 1/5

8:11h
Z/017,60/C49/011/0077013
E073/E535

Silicon Single Crystals for Power Rectifier.

and also by Hannay (Ref.5). Rosse (Ref.6) also considers the suspended zone method suitable for producing silicon power rectifiers. In the CKD Laboratories the aim was not to seek maximum widening of the ingot diameter and diameters of 20 to 22 mm were considered sufficient. A photo of the equipment used for producing silicon single crystals by the method of the suspended zone is shown in Fig.1. The equipment was developed in the Semiconductor Laboratories of CKD, Prague. The high frequency generator GV 6-S²⁸ which has been used in this equipment, is described in a paper by K. Regner (pp.565-569 of this issue). The second part of the equipment is the one for vertical movement with special arrangement of the fusion space and electrical control. The third part is formed by the tap-changing autotransformer designed for controlling the output of the generator. The equipment also contains apparatus for purification of hydrogen and, if necessary, for hydrogen generation by means of electrolysis, apparatus for argon purification and mixing equipment for obtaining any desired mixture of argon and

Card 2/5

Silicon Single Crystals for Power Rectifiers

hydrogen used as a protective atmosphere. The focal point of the equipment is the melting space, shown diagrammatically by the sketch, Fig.2. In designing this, the experience of Dr. Z. Trousil (Ref.7), Institute of Technical Physics (UTF), who placed the inductor of the high frequency generator inside a silicon tube, was taken into consideration. In the given case the silicon tube was substituted by a water-cooled fully metallic chamber, which completely surrounds the inductor so that all radiation of high frequency energy is screened off. The dimensions of the fusion chamber are so chosen that the currents induced in it should not bring about any loss of the heating power. The heating coil has three turns, is placed in a separate ring which can be taken out and cleaned. The bottom part of the chamber is fixed and is provided with a spy-hole for indirect observation of the process by means of a mirror. The top part is removeable so that access can be gained to the inside of the chamber. The maximum speed of movement is so chosen that in a single zone the diameter of the ingot can be increased or reduced by a factor of three, with a normal zoning speed of 5 to 18 cm/hour. The best growing speed

Card 3/5

841114

Z/017/60/049/011/007/013
E073/E535

Silicon Single Crystals for Power Rectifiers

was found to be 5 to 6 cm/hour. Fast changes in the speed of growing and in width should be avoided. If the ingot is placed onto a wide single crystal germination, the lattice parameters are unfavourable although the germination may be of a high quality. Particularly favourable is a slight widening and subsequent narrowing followed again by widening to the final diameter (see Fig.4). The starting material is chemically pre-purified silicon, which is additionally purified by zonal smelting. From this, silicon ingots of 12 mm diameter are obtained, one end of which is pure (specific resistance 100 to 300 Ohm cm), whilst the other end is contaminated by impurities. By means of various measures, briefly enumerated in the paper, the quality of the lattice has been considerably improved. As a result of this, crystals are being manufactured with dislocation densities between 20 000 and 30 000/cm², the distribution of which is uniform. The apparatus does not bring about a deterioration in the quality of the material so that the resistance and the type of the starting material remains unchanged.

Card 4/5

Z/017/60/C49/011/007/013
E073/E535

Silicon Single Crystals for Power Rectifiers

The lifetime of the crystal is usually 200 μ sec and in some cases it is even longer. The parameters of the produced material satisfy the requirements to be met in the manufacture of silicon rectifiers. Further intensive development work is proceeding in this field. There are 5 figures and 7 references: 2 Czech, 1 German and 4 English.

"Cultivation of Chorion Vili in Vitro."

Prague, Casopis Lekaru Ceskych, Vol 102, No 42, 1963, pp 1162 - 1165

Abstract: [Authors' English Summary] Description of histologic and histochemical picture of sections from cultures of chorion vili, cultivated in vitro for 120 hours is given. Two different forms of plasmodial structures were found on the surface of explanted vili. Growth of epithelial cells with the character of cytotrophoblast was observed.

TITLE: Numerical calculation of magnetization reversal curves of ferromagnets by
means of a generalized Preisach diagram

SOURCE: Ceskoslovensky casopis pro fysiku, no. 4, 1965, 304-307

TOPIC TAGS: ferromagnetic material, magnetization curve, external magnetic field,
demagnetization

ABSTRACT: The paper describes a method which can be used to calculate the magneti-
zation of a ferromagnetic sample by means of a generalized Preisach diagram if the
magnetic history of the sample is known, that is, if the course of the external mag-
netic field which acted on the sample from the moment when it was in the demagnetized
state is known. Orig. art. has: 9 formulas and 2 figures. [Based on author's Eng.
abst.] [JPRS: 32,945]
